Features

- Variable displacement axial piston motor of bent axis design for hydrostatic transmissions in open and closed circuits
- For use in mobile and stationary applications
- The wide control range enables the variable displacement motor to satisfy the requirement for high rotational speed and high torque.
- The displacement is continuously variable from $V_{g \max}$ to $V_{g \min} = 0$.
- The output speed depends on the flow capacity of the pumps and the displacement of the motor.
- The torque increases with the pressure differential between the high and low pressure side and with increasing displacement.
- Wide control range with hydrostatic transmissions
- Wide selection of regulating and control devices
- Cost savings as no need for shiftable gearboxes and possibility to use smaller pumps
- Rugged, compact bearing system with long service life
- High power density
- Favorable start-up efficiency
- Low moment of inertia
- Large swivel range

Technical Data

Pressure fluid

Before starting project planning, please refer to our data sheets RA 90220 (mineral oil), RA 90221 (environmentally-friendly pressure fluids) and RA 90223 (HF pressure fluids) for detailed information regarding the choice of pressure fluids and conditions of use.

The AA6VM variable displacement motor is not suitable for use with HFA. If HFB, HFC and HFD or environmentally-friendly pressure fluids are being used, the constraints regarding technical data and seals mentioned in RA 90221 and RA 90223 must be observed.

If necessary, please contact us to discuss the type of pressure fluid you intend to use.

Viscosity range

We recommend that a viscosity (at operating temperature) for optimum efficiency and service life purposes of

$$v_{\text{opt}} = \text{optimum viscosity } 80 \dots 170 \text{ SUS (16 to } 36 \text{ mm}^2/\text{s})$$

be chosen, taken the circulation temperature (closed circuit) and reservoir temperature (open circuit) into account.

Limits of viscosity range

The following values apply in extreme cases:

Sizes 28 to 200:

$v_{\text{min}} = 42 \text{ SUS (5 mm}^2/\text{s)}$
short-term ($t < 3 \text{ min}$) at max. permitted temperature of
 $t_{\text{max}} = +240^\circ\text{F (+115}^\circ\text{C)}$.

$v_{\text{max}} = 7400 \text{ SUS (1600 mm}^2/\text{s)}$
short-term ($t < 3 \text{ min}$) on cold start ($p < 435 \text{ psi / 30 bar}$,
 $n \leq 1000 \text{ rpm}$, $t_{\text{min}} = -40^\circ\text{F / -40}^\circ\text{C}$).

Sizes 250 to 1000:

$v_{\text{min}} = 60 \text{ SUS (10 mm}^2/\text{s)}$
short-term ($t < 3 \text{ min}$) at max. permitted leakage-oil temperature of
 $t_{\text{max}} = +195^\circ\text{F (+90}^\circ\text{C)}$.

$v_{\text{max}} = 4600 \text{ SUS (1000 mm}^2/\text{s)}$
short-term ($t < 3 \text{ min}$) on cold start ($p < 435 \text{ psi / 30 bar}$,
 $n \leq 1000 \text{ rpm}$, $t_{\text{min}} = -13^\circ\text{F / -25}^\circ\text{C}$).

Note that the maximum pressure fluid temperature must not be exceeded locally either (e.g. during storage).

Special measures are necessary at temperatures between -13°F and -40°F (-25°C and -40°C). Please contact us.

See RE 90300-03-B for detailed information about use at low temperatures.

Selection chart

Details regarding the choice of pressure fluid

The correct choice of pressure fluid requires knowledge of the operating temperature in relation to the ambient temperature: in a closed circuit the circulation temperature, in an open circuit the reservoir temperature.

The pressure fluid should be chosen so that the viscosity in the operating temperature range is within the optimum area (v_{opt}) - the shaded area of the selection chart. We recommend that the higher viscosity class be selected in each case.

Example: At an operating temperature of $140^\circ\text{F (60}^\circ\text{C)}$, the viscosity classes VG 46 and VG 68 are within the optimum viscosity area (v_{opt} , shaded field). In this case we would recommend VG 68.

Please note: The leakage-oil temperature, which is affected by pressure and rotational speed, is always higher than the circulation temperature or reservoir temperature. At no point in the system must the temperature be higher than $240^\circ\text{F (115}^\circ\text{C)}$ for sizes 28 to 200 or $195^\circ\text{F (90}^\circ\text{C)}$ for sizes 250 to 1000.

If this cannot be achieved due to unusual operating parameters or high ambient temperatures, we recommend flushing of the case via port U or the use of a flushing and boost pressure valve (see page 55).

Technical Data

Filtering

The finer the filtering, the cleaner the fluid and the greater the service life of the axial piston unit.

To ensure proper function of the axial piston unit, the pressure fluid must have a cleanliness level of at least 20/18/15 according to ISO 4406.

At very high pressure fluid temperatures (195°F to max. 240°F / 90°C to max. 115°C, not permitted for sizes 250 to 1000), a cleanliness level of at least 19/17/14 according to ISO 4406 is required.

Please contact us if these cleanliness levels cannot be achieved.

Temperature range of shaft seal

The FKM shaft seal is suitable for case temperatures of -13°F to 240°F (-25°C to +115°C) for sizes 28 to 200 and -13°F to 195°F (-25°C to +90°C) for sizes 250 to 1000

Note:

A NBR shaft seal is necessary at temperatures below -13°F / -25°C (permitted temperature range: -40°F to 195°F / -40°C to +90°C). Please contact us.

Operational pressure range

Maximum pressure on port A or B (pressure data to DIN 24312)

for sizes 28 to 200

Nominal pressure p_N _____ 5800 psi (400 bar)*

Maximum pressure p_{max} _____ 6525 psi (450 bar)*

Total pressure (pressure A + pressure B) p_{max} _____ 10150 psi (700 bar)

*) Size 80: p_N = 5100 psi (350 bar), p_{max} = 5800 psi (400 bar)

for sizes 250 to 1000

Nominal pressure p_N _____ 5100 psi (350 bar)

Maximum pressure p_{max} _____ 5800 psi (400 bar)

Total pressure (pressure A + pressure B) p_{max} _____ 10150 psi (700 bar)

Please note:

Sizes 28 to 200: At the shaft end **S** or **Z**, a nominal pressure of p_N = 4570 psi (315 bar) is permitted for the driven shaft end that is subjected to transverse bending (pinions, V-belts)!

Size 80: p_N = 2900 psi (200 bar). Please contact us.

Sizes 250 to 1000: Please contact us.

In cases of pulsating loading above 4570 psi (315 bar), we recommend the version with splined shaft.

Direction of flow

Clockwise direction of rotation Counterclockwise direction of rotation

A to B

B to A

Speed range

No limit to minimum speed n_{min} . If uniform motion is required, n_{min} must not be less than 50 rpm. See table on page 6 for maximum speed.

Long-Life bearing (sizes 250 to 1000)

For long service life and use with HF pressure fluids.

Same external dimensions as motor with standard bearing.

A long-life bearing can be retrofitted.

Flushing of bearing and case via port U recommended.

Flow (recommended)

Size	250	355	500	1000
q_v flow gpm	2.6	4.2	4.2	4.2
L/min	10	16	16	16

Case drain pressure

The service life of the sealing ring is affected by the speed of the motor and the case drain pressure. The permitted loading with intermittent case drain pressure depends on the rotational speed (see chart). Short-term ($t < 5$ s) pressure spikes of up to 90 psi (6 bar) absolute are permitted.

The average permanent case drain pressure must not exceed 45 psi (3 bar) absolute.

The pressure in the case must be equal to or greater than the external pressure on the shaft seal.

The pure mechanical resistance to case pressure is approximately 290 psi (20 bar).

Sizes 28 to 200

Sizes 250 to 1000

Effect of case pressure on start of control

An increase in the case pressure has an effect on the following settings when control of the variable displacement motor begins:

HA1T (sizes 28 to 200) _____ increase

HD, EP, HA, HA.T (sizes 250 to 1000): _____ increase

DA : _____ reduction

The start of control is set in the factory at a case pressure of

$p_{abs} = 30$ psi (2 bar) for sizes 28 to 200 and

$p_{abs} = 15$ psi (1 bar) for sizes 250 to 1000.

¹⁾ The minimum and maximum displacement are continuously variable, see model codes on page 2.

(default setting sizes 250 to 1000 unless specified in order: $V_{g\ min} = 0.2 \cdot V_{g\ max}$, $V_{g\ max} = V_{g\ max}$).

²⁾ sizes 28 to 200: $\Delta p = 5800$ psi (400 bar); sizes 250 to 1000: $\Delta p = 5100$ psi (350 bar)

Minimum inlet pressure on service line port A(B)

Permitted displacement in relation to rotational speed

To prevent damage to the variable displacement motor, there has to be a minimum inlet pressure in the inlet area. The minimum inlet pressure depends on the speed and swivel angle (displacement) of the variable displacement motor.

Please contact us if these conditions cannot be satisfied.

Technical Data

1) During intermittent operation (sizes 28 to 200).

2) When stopped or when axial piston unit working in pressureless conditions. Higher forces are permitted when under pressure. Please contact us.

3) Max. permissible axial force when stopped or when axial piston unit working in pressureless conditions.

4) Please contact us.

When considering the permissible axial force, the force-transfer direction must be taken into account.

$-F_{ax \max}$ = increase in service life of bearings

$+F_{ax \max}$ = reduction in service life of bearings
(avoid if at all possible)

Determining the size

$$\text{Flow } q_v = \frac{V_g \cdot n}{231 \cdot \eta_v} \text{ gpm} \quad \left(q_v = \frac{V_g \cdot n}{1000 \cdot \eta_v} \text{ L/min} \right)$$

$$\text{Output speed } n = \frac{q_v \cdot 231 \cdot \eta_v}{V_g} \text{ rpm} \quad \left(n = \frac{q_v \cdot 1000 \cdot \eta_v}{V_g} \text{ rpm} \right)$$

$$\text{Output torque } T = \frac{V_g \cdot \Delta p \cdot \eta_{mh}}{24 \cdot \pi} \text{ lb-ft} \quad \left(T = \frac{V_g \cdot \Delta p \cdot \eta_{mh}}{20 \cdot \pi} \text{ Nm} \right)$$

$$\text{Output power } P = \frac{2\pi \cdot T \cdot n}{33000} = \frac{q_v \cdot \Delta p \cdot \eta_t}{1714} \text{ HP}$$

$$\left(P = \frac{2\pi \cdot T \cdot n}{60000} = \frac{q_v \cdot \Delta p \cdot \eta_t}{600} \text{ kW} \right)$$

V_g = Displacement per revolution in in³ (cm³)

Δp = Differential pressure in psi (bar)

η_v = Volumetric efficiency

η_{mh} = Mechanical-hydraulic efficiency

η_t = Overall efficiency

Effect of transverse force F_q on the service life of the bearings

By selecting a suitable force-transfer direction of F_q , the stress on the bearing caused by the internal transmission forces can be reduced, thus achieving the optimum service life for the bearing. Recommended position of mating gear depending on direction of rotation. Examples:

Toothed gear output

V-belt output

HD - Hydraulic Control, Pilot Pressure Dependent

The pilot pressure dependent hydraulic system permits continuous control of the displacement according to the pilot pressure signal. The control is proportional to the pilot pressure present on port X.

Normal version:

- start of control at $V_{g \max}$ (max. torque, min. speed)
- end of control at $V_{g \min}$ (min. torque, max. permitted speed)

Please note:

- Maximum permitted pilot pressure: 1450 psi (100 bar)
- The required control oil is taken from the high pressure. Therefore, a Δp of at least 218 psi (15 bar) on the supply pressure is needed. If the Δp on the supply pressure is < 218 psi (15 bar) (e.g. when idle), an auxiliary pressure of at least 218 psi (15 bar) above the supply pressure must be applied on port G via an external check valve (valid for size 28...200, for size 250...1000 see page 11).
- Please state the required start of control in plain text when placing your order, e.g.: start of control at 145 psi (10 bar)

The following only applies to sizes 250 to 1000:

- The start of control and the HD characteristic are influenced by the pressure in the case. A rise in pressure in the case causes an increase in the start of control and a corresponding parallel movement of the performance curve (see page 5).
- Fluid will escape from port X at the rate of 0.08 gpm (0.3 l/min) due to internal leakage (operating pressure > pilot pressure). The actuation must be designed appropriately to ensure correct control pressure.

HD1: pilot pressure rise $\Delta p_s = 145$ psi (10 bar)

A rise in pilot pressure of 145 psi (10 bar) on port X causes a reduction in the displacement from $V_{g \max}$ to 0 cm³ (sizes 28 to 200) or from $V_{g \max}$ to 0.2 $V_{g \max}$ (sizes 250 to 1000).

Start of control (setting range) ____ 30 – 290 psi (2 – 20 bar)

Default setting: start of control at 45 psi (3 bar)
end of control at 190 psi (13 bar)

HD2: pilot pressure rise $\Delta p_s = 365$ psi (25 bar)

A rise in pilot pressure of 365 psi (25 bar) on port X causes a reduction in the displacement from $V_{g \max}$ to 0 cm³ (sizes 28 to 200) or from $V_{g \max}$ to 0.2 $V_{g \max}$ (sizes 250 to 1000).

Start of control, setting range ____ 75 – 725 psi (5 – 50 bar)

Default setting: start of control at 145 psi (10 bar)
end of control at 510 psi (35 bar)

HD3: pilot pressure rise $\Delta p_s = 508$ psi (35 bar)

A rise in pilot pressure of 508 psi (35 bar) on port X causes a reduction in the displacement from $V_{g \max}$ to 0.2 $V_{g \max}$ (sizes 250 to 1000).

Start of control, setting range ____ 102 – 725 psi (7 – 50 bar)

Default setting: start of control at 145 psi (10 bar)
end of control at 653 psi (45 bar)

HD - Hydraulic Control, Pilot Pressure Dependent

HD1, HD2, HD3:

Hydraulic control, pilot pressure dependent

Sizes 28 to 200

Sizes 250 to 1000

HD.D: pressure control, direct

The pressure control overlays the HD function. If the load moment or a reduction in the swivel angle of the motor causes the system pressure to rise, the motor will start to swivel to a greater angle when the pressure reaches the value set on the pressure control.

The increase in the displacement and the resulting reduction in pressure cause the controller deviation to decrease. With the increase in displacement the motor develops more torque, while the pressure remains constant.

Setting range on pressure control valve:

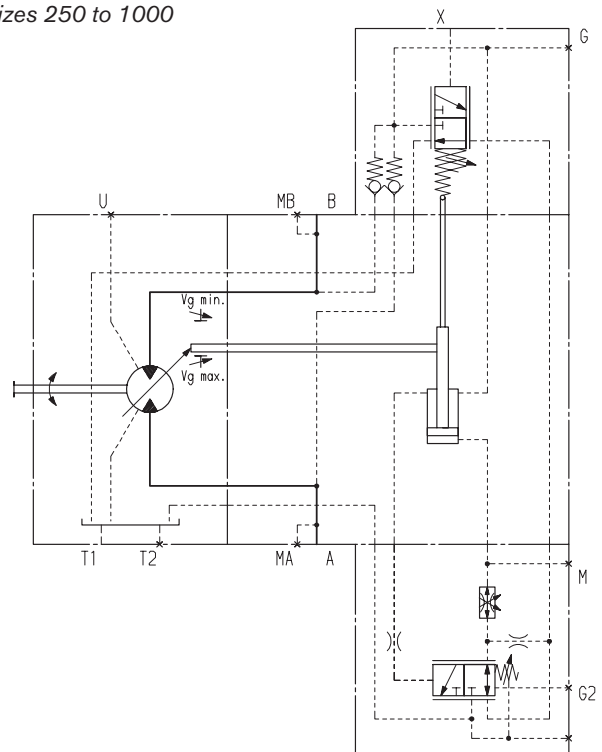

Sizes 28 to 200 _____ 1160 – 5800 psi (80 – 400 bar)

Sizes 250 to 1000 _____ 1160 – 5100 psi (80 – 350 bar)

Sizes 28 to 200

Sizes 250 to 1000

HD - Hydraulic Control, Pilot Pressure Dependent

HD.E: pressure control, direct with 2nd pressure setting

Sizes 28 to 200

Connecting an external pilot pressure to port G2 allows the pressure regulator setting to be overridden and a second pressure setting to be used.

Required pilot pressure on port G2:

Sizes 28 to 200 _____ $p_{St} = 290 - 725 \text{ psi} (20 - 50 \text{ bar})$

Please specify the 2nd pressure setting in plain text when placing your order.

Sizes 28 to 200

Sizes 250 to 1000 (HD.D)

Pressure control with 2nd pressure setting provided as standard with HD.D (see page 9).

Connecting an external pilot pressure to port G2 allows the pressure regulator setting to be overridden and a second pressure setting to be used.

Required pilot pressure on port G2:

Sizes 250 to 1000 _____ $p_{St} \geq 1450 \text{ psi} (100 \text{ bar})$

Please specify the 2nd pressure setting in plain text when placing your order.

HD.G: pressure control, remote

Sizes 250 to 1000

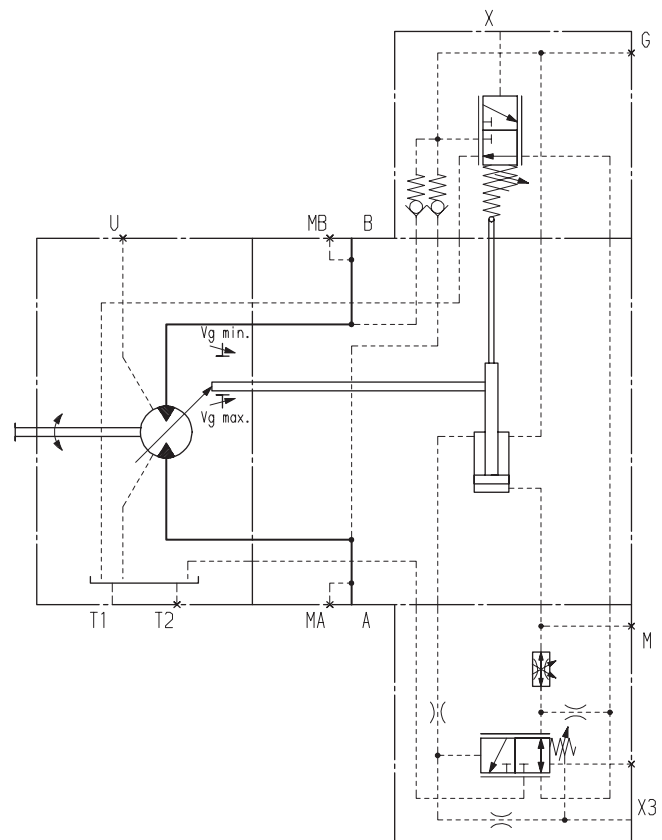

When the specified pressure is reached, the remote pressure control regulates the motor continuously up to the maximum displacement $V_{g \max}$. A pressure relief valve (not in the scope of supply) controls the internal discharge stop valve. The pressure relief valve is separate from the motor and is connected to X3. If the pressure setpoint value is not reached, the valve is subjected to even pressure from both sides, in addition to the spring force, and remains closed. The pressure setpoint lies between 1160 and 5100 psi (80 and 350 bar). When this pressure is obtained on the separate pressure relief valve, the pressure relief valve opens and the pressure on the reservoir side of the spring reduces. The internal control valve switches and the motor swivels to maximum displacement $V_{g \max}$.

The default value for the differential pressure on the control valve is 365 psi (25 bar). We recommend the following external pressure relief valve:

DBD 6 (hydraulic) to RE 25402

The max. line length must not exceed 6 ft (2 m).

Sizes 250 to 1000

HZ - Hydraulic Two-Point Control

Hydraulic two-point control allows the displacement to be set to $V_{g \min}$ or $V_{g \max}$ by switching the pilot pressure on port X on or off.

no pilot pressure \triangleq position at $V_{g \max}$

pilot pressure switched $> 145 \text{ psi (10 bar)}$ \triangleq position at $V_{g \max}$

Normal version:

- start of control at $V_{g \max}$ (max. torque, min. speed)
- end of control at $V_{g \min}$ (min. torque, max. permitted speed)

Please note:

- Maximum permitted pilot pressure: 1450 psi (100 bar)
- Size 28...200:
The required control oil is taken from the high pressure. Therefore, a Δp of at least 218 psi (15 bar) on the supply pressure is needed. If the Δp on the supply pressure is $< 218 \text{ psi (15 bar)}$ (e.g. when idle), an auxiliary pressure of at least 218 psi (15 bar) above the supply pressure must be applied on port G via an external check valve.

Size 250...1000:

The required control oil is taken from the high pressure side. For this a minimum operating pressure of 218 psi (15 bar) is needed. If the operating pressure is $< 218 \text{ psi (15 bar)}$, an auxiliary pressure of at least 218 psi (15 bar) must be applied on port G via an external check valve.

The following only applies to sizes 250 to 1000:

- Fluid will escape from port X at the rate of 0.08 gpm (0.3 l/min) due to internal leakage (operating pressure $>$ pilot pressure).
- The actuation must be designed appropriately to ensure correct control pressure.

HZ1: Hydraulic two-point control

Sizes 28, 140, 160, 200

HZ3: Hydraulic two-point control

Sizes 55, 80, 107

HZ: Hydraulic two-point control

Sizes 250 to 1000

EP - Electrical Control With Proportional Solenoid

Electrical control using a proportional solenoid (sizes 28 to 200) or proportional valve (sizes 250 to 1000) permits continuous control of the displacement according to an electrical signal. The control is proportional to the applied electrical control current. In the case of sizes 250 to 1000, an external pressure of $p_{\min} = 435 \text{ psi (30 bar)}$ is necessary for the control oil supply to port P ($p_{\max} = 1450 \text{ psi (100 bar)}$).

Normal version:

- start of control at $V_{g \max}$ (max. torque, min. speed)
- end of control at $V_{g \min}$ (min. torque, max. permitted speed)

Please note:

- The required control oil is taken from the high pressure, so a Δp of at least 218 psi (15 bar) on the supply pressure is needed. If the Δp on the supply pressure is $< 218 \text{ psi (15 bar)}$ (when idle), an auxiliary pressure of at least 218 psi (15 bar) above the supply pressure must be applied on port G via an external check valve (valid for size 28...200, for size 250...1000 see page 11).
- The start of control and the EP characteristic are influenced by the pressure in the case. A rise in pressure in the case causes an increase in the start of control and a corresponding parallel movement of the performance curve (sizes 250 to 1000, see page 5).

Technical data, solenoid in EP1, EP2	EP1	EP2
Voltage	12 V ($\pm 20 \%$)	24 V ($\pm 20 \%$)
Control current sizes 28 to 200		
Control starts at $V_{g \max}$	400 mA	200 mA
Control ends at $V_{g \min}$	1200 mA	600 mA
Control current sizes 250 to 1000		
Control starts at $V_{g \max}$	900 mA	450 mA
Control ends at $V_{g \min}$	1400 mA	700 mA
Maximum current	1,54 A	0,77 A

EP - Electrical Control With Proportional Solenoid

EP.G: Electrical control with pressure control, remote

Sizes 250 to 1000

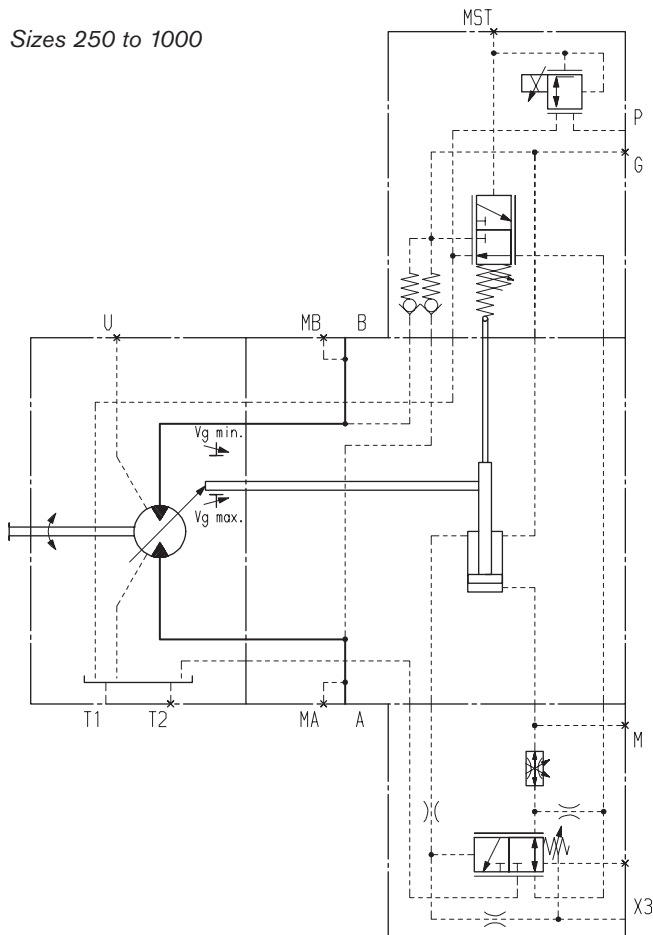

When the specified pressure is reached, the remote pressure control regulates the motor continuously up to the maximum displacement $V_{g \max}$. A pressure relief valve (not in the scope of supply) controls the internal discharge stop valve. The pressure relief valve is separate from the motor and is connected to X3.

If the specified pressure value is not reached, the valve is subjected to even pressure from both sides, in addition to the spring force, and remains closed. The pressure setpoint lies between 1160 and 5100 psi (80 and 350 bar). When this pressure is reached on the separate pressure relief valve, the limiter opens and the pressure on the reservoir side of the spring reduces. The internal control valve switches and the motor swivels to maximum displacement $V_{g \max}$. The default value for the differential pressure on the control valve is 365 psi (25 bar). We recommend the following external pressure relief valve:

DBD 6 (hydraulic) to RE 25402

The max. line length must not exceed 6 ft (2 m).

Sizes 250 to 1000

EZ - Electrical Two-Point Control, With Solenoid

Electrical two-point control with a solenoid allows the displacement to be set to $V_{g \min}$ or $V_{g \max}$ by switching the electrical current to the solenoids on or off.

Please note:

- Size 28...200:
The required control oil is taken from the high pressure. Therefore, a Δp of at least 218 psi (15 bar) on the supply pressure is needed. If the Δp on the supply pressure is < 218 psi (15 bar) (e.g. when idle), an auxiliary pressure of at least 218 psi (15 bar) above the supply pressure must be applied on port G via an external check valve.

Size 250...1000:

The required control oil is taken from the high pressure side. For this a minimum operating pressure of 218 psi (15 bar) is needed. If the operating pressure is < 218 psi (15 bar), an auxiliary pressure of at least 218 psi (15 bar) must be applied on port G via an external check valve.

HA - Automatic Control, High-Pressure Dependent

In the case of automatic high-pressure dependent control, the displacement is set automatically according to the operating pressure.

The control unit measures the internal operating pressure at A or B (no control line required) and, when the pressure reaches the setpoint value of $V_{g \min}$ set on the controller, swivels with increasing operating pressure to $V_{g \max}$.

Normal version HA1, HA2:

Start of control at $V_{g \min}$ (min. torque, max. speed)

End of control at $V_{g \max}$ (max. torque, min. speed)

Please note:

- For safety reasons, winch drives are not permitted with start of control at $V_{g \min}$ (default with HA).

- The required control oil is taken from the high pressure, so a Δp of at least 218 psi (15 bar) on the supply pressure is needed. If the Δp on the supply pressure is < 218 psi (15 bar) (when idle), an auxiliary pressure of at least 218 psi (15 bar) above the supply pressure must be applied on port G via an external check valve (valid for size 28...200, for size 250...1000 see page 11).
- The start of control and the HA characteristic are influenced by the pressure in the case. A rise in pressure in the case causes an increase in the start of control and a corresponding parallel movement of the performance curve. Only with HA1, HA2, HA.T (sizes 250 to 1000) and HA1T (sizes 28 to 200), see page 5.
- Fluid will escape from port X at the rate of 0.08 gpm (0.3 l/min) due to internal leakage (operating pressure > pilot pressure). The actuation must be designed appropriately to ensure correct control pressure.
Only with HA.T control.

HA1: approximate with no pressure rise

A rise in operating pressure of $\Delta p \leq 145$ psi (10 bar) causes an increase in the displacement from 0 cm³ to $V_{g \max}$ (sizes 28 to 200) or from 0.2 $V_{g \max}$ to $V_{g \max}$ (sizes 250 to 1000).

Start of control, setting range

Sizes 28 to 200 _____ 1160 – 5100 psi (80 – 350 bar)

Sizes 250 to 1000 _____ 1160 – 4930 psi (80 – 340 bar)

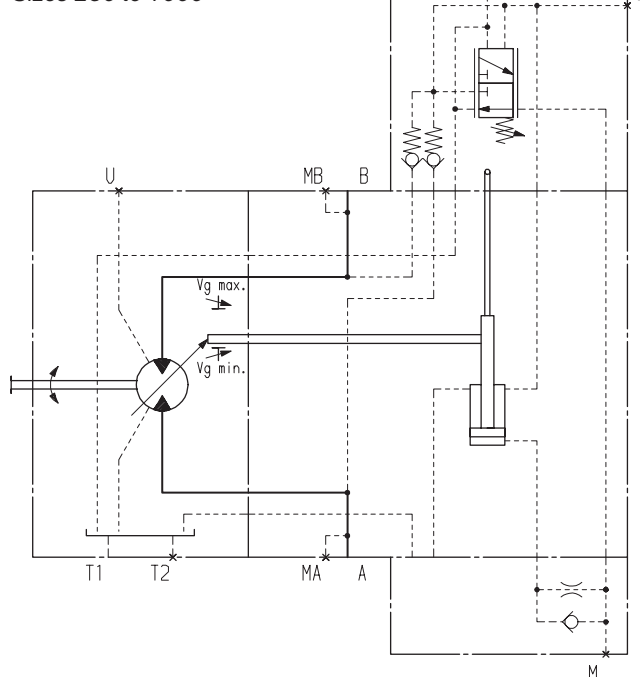

Please state the required start of control in plain text when placing your order, e.g.: start of control at 4350 psi (300 bar)

Sizes 28 to 200

Sizes 250 to 1000

HA - Automatic Control, High-Pressure Dependent

HA2: pressure rise $\Delta p = 1450$ psi (100 bar)

Sizes 28 to 200

A rise in operating pressure of $\Delta p = 1450$ psi (100 bar) causes an increase in the displacement from 0 cm^3 to $V_{g \max}$ (sizes 28 to 200) or from $0.2 V_{g \max}$ to $V_{g \max}$ (sizes 250 to 1000).

Start of control, setting range

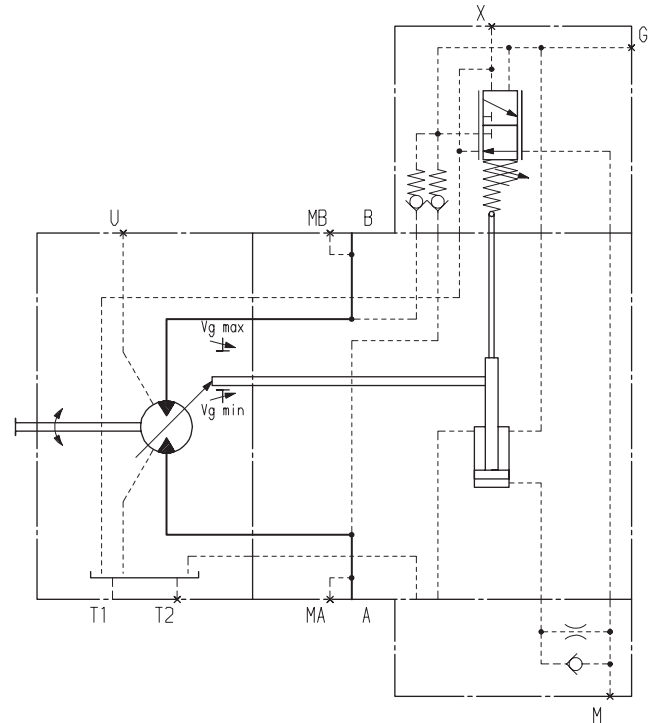

Sizes 28 to 200 _____ 1160 – 5100 psi (80 – 350 bar)

Sizes 250 to 1000 _____ 1160 – 3600 psi (80 – 250 bar)

Please state the required start of control in plain text when placing your order, e.g.: start of control at 2900 psi (200 bar)

Sizes 250 to 1000

HA - Automatic Control, High-Pressure Dependent (override)

HA.T: Hydraulic override of pressure setpoint

In the case of HA control, the start of control can be influenced by applying a pilot pressure to port X.

For each 14.5 psi (1 bar) of pilot pressure, the start of control is reduced by 247 psi (17 bar) for sizes 28 to 200 or 116 psi (8 bar) for sizes 250 to 1000.

Examples (sizes 28 to 200):

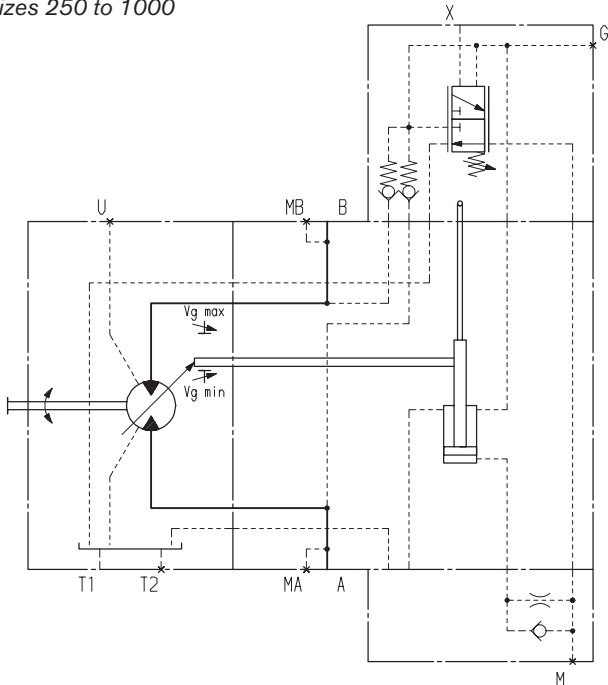

Start of control setting	4350 psi (300 bar)	4350 psi (300 bar)
Pilot pressure on port X	0 psi (0 bar)	145 psi (10 bar)
gives start of control at	4350 psi (300 bar)	1885 psi (130 bar)

If the override is only intended to set the max. displacement (motor swivels to $V_{g\ max}$), a maximum pilot pressure of 1450 psi (100 bar) is permitted.

Sizes 28 to 200

Sizes 250 to 1000

HA.U1, U2: Electrical override of pressure setpoint

With the HA control, high-pressure dependent control can be overridden by an electrical signal on a solenoid. In the case of an override, the variable displacement motor swivels to the maximum swivel angle.

The start of control can be set to between 1160 and 4350 psi (80 and 300 bar) (specify value in plain text when placing your order).

Technical data solenoid b	U1	U2
(electrical override)		
Voltage	12 V (±20 %)	24 V (±20 %)
No override	de-energized	de-energized
Position at $V_{g\ max}$	Current on	Current on
Nominal resistance (at 20°C)	4.8 Ω	19.2 Ω
Nominal output	30 W	30 W
Active current, minimum required	1.5 A	0.75 A
Operating time	100 %	100 %
Degree of protection	see connector design, page 60	

HA1U1, HA1U2: Sizes 28 to 200

HA2U1, HA2U2: Sizes 28 to 200

HA - Automatic Control, High-Pressure Dependent (override)

HA.R1, R2: Electrical override of pressure setpoint using electrical travel direction valve

With the HA control, high-pressure dependent control can be overridden by an electrical signal on solenoid b. In the case of an override, the variable displacement motor swivels to the maximum swivel angle.

The travel direction valve ensures that the preselected pressure outlet of the hydraulic motor always controls the swivel angle, even if the high pressure side changes (e.g. during a descent). This therefore prevents an undesirable swiveling of the variable displacement motor to a greater displacement.

Depending on the direction of rotation (direction of travel), the travel direction valve (see page 21) can be actuated through the compression spring or solenoid a.

Technical data, solenoid a (travel direction valve)		R1	R2

HA2R1, HA2R2: Sizes 28 to 200

DA - Hydraulic Control, Speed Dependent

The AA6VM (A6VM) variable displacement motor with speed-dependent hydraulic control is best used for hydrostatic transmissions in combination with the AA4VG variable displacement pump with DA control.

The pilot pressure derived from the driving speed of the AA4VG variable displacement pump, together with the operating pressure, regulate the swivel angle of the hydraulic motor.

Increasing driving speed, i.e. rising pilot pressure, causes the motor to swivel to a lower displacement (lower torque, higher speed), depending on the operating pressure.

If the operating pressure rises above the value set on the controller, the motor swivels to a higher displacement (higher torque, lower speed).

The design of a drive with DA control must be carried out using the technical data relating to the AA4VG variable displacement pump with DA control.

Detailed Information can be obtained from our sales departments and on the Internet at www.boschrexroth.com/da-control.

Please note:

- The start of control and the DA characteristic are influenced by the pressure in the case. A rise in pressure in the case causes a drop in the start of control and a corresponding parallel movement of the performance curve (see page 5).

DA, DA1, DA4: Hydraulic control, speed dependent with hydraulic travel direction valve

The travel direction valve is operated according to the direction of rotation (direction of travel) using the control pressures X_1 or X_2 .

Direction of rotation	Operating pressure in	Pilot pressure in
clockwise	A	X_1
counter-clockwise	B	X_2

Sizes 28 to 200

Sizes 250 to 1000

DA - Hydraulic Control, Speed Dependent

DA2, DA3, DA5, DA6:

Hydraulic control, speed dependent with electrical travel direction valve + electrical $V_{g \max}$ switch

Depending on the direction of rotation (direction of travel), the travel direction valve can be actuated through the compression spring or solenoid a.

By connecting an electrical current to solenoid b, the controller can be overridden and the motor adjusted to max. displacement (high torque, low speed) (so called "electrical $V_{g \max}$ switch").

Technical data, solenoids a and b		DA2, DA5	DA3, DA6

Sizes 28 to 200

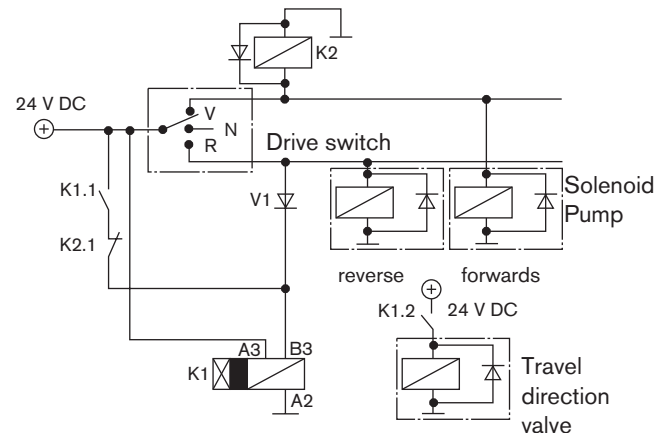

Electrical travel direction valve (for DA, HA.R)

The travel direction valve of the motor is switched using the 4/3 directional-control valve on the control unit of the driving pump. Usually, this provides trouble-free drivability of the driven machine.

However, with unfavorable operating parameters this can lead to undesired conditions (jerky, uncontrolled braking when switching the drive lever into neutral). The reason is that the travel direction valve of the motor operates as soon as the pump is in the neutral position, causing the motor controller to detect a braking pressure, which is then used to control the swivel angle.

To prevent this, the existing switching position on the travel direction valve must be retained while the pump is being put into the neutral position, i.e. an energized valve must remain energized. This can be done using the circuit shown below.

The motor should swivel more slowly than the pump. We therefore recommend that actuation be delayed by approximately 0.8s. This prevents too long a delay when reversing lightweight units.

DA2, DA3, DA5, DA6 control

HA1R, HA2R. control (see page 19)

Solenoid a on travel direction valve

Flushing and Boost Pressure Valve

Before finalising your design, please request a certified drawing.
Dimensions in inches and (millimeters).

The flushing and boost pressure valve is used to remove heat from the closed circuit and to ensure that a minimum charge pressure is present (opening pressure 230 psi/16 bar, fixed; note when setting primary valve). A side effect is flushing of the case.

Warm pressure fluid is removed from the relevant low pressure side into the motor case. This is then fed into the reservoir, together with the leakage fluid. The pressure fluid drawn out of the closed circuit in this way has to be replaced by cooled oil that is pumped in by the charge pump.

In the open circuit, the flushing and boost pressure valve is used solely to flush the case from the return line.

The valve is fitted to the variable displacement motor (or integrated into the servo unit, depending on the type of control and the size).

Orifices can be used to adjust the flow as required.

Standard flow at low pressure $\Delta p_{ND} = 365 \text{ psi (25 bar)}$

Size	Quantity	Mat. no. of orifice
28, 55	0.9 gpm (3.5 l/min)	R909651766
80	1.3 gpm (5 l/min)	R909419695
107	2.1 gpm (8 l/min)	R909419696
140, 160, 200	2.6 gpm (10 l/min)	R909419697
250	2.6 gpm (10 l/min)	On request
355-1000	4.2 gpm (16 l/min)	On request

For sizes 28 to 200, orifices for flows of 1.3 - 2.6 gpm (3.5 - 10 l/min) can be supplied. In the case of non-standard flows, please specify the orifice you require when placing your order.

Counterbalance Valve BVD (sizes 55 to 160)

Function

Driving/winch counterbalance valves prevent the motor speeding up out of control during descents/load reduction and consequently cavitation of axial piston motors operating in an open circuit. Cavitation occurs in axial piston motors as soon as the speed from the drive element on the outside exceeds the speed governed by the incoming flow volume.

Please note

- BVD counterbalance valve must be specified explicitly in the order. We recommend ordering the counterbalance valve and the motor as a set. Ordering example: AA6VM80HA1T/63W–VSC380A + BVD20F27S/41B–V03K16D0400S12
- For safety reasons, winch drive are forbidden with start of control at $V_{g \min}$ (e.g. HA)!
- The counterbalance valve does not replace the mechanical service brake and parking brake.
- Note the detailed information about the BVD counterbalance valve contained in RE 95522

Driving counterbalance valve BVD..F

Version with start of control at $V_{g \min}$ (standard for HA).

Winch counterbalance valve BVD..W

Version with start of control at $V_{g \min}$ (standard for HD, EP).

Example of application

- Transmission on wheeled excavators

Typical applications

- Winch gears in cranes
- Slew gears in excavator crawlers

Example circuit diagram for transmission on wheeled excavators

Fastening the counterbalance valve

When delivered, the counterbalance valve is fastened to the motor by 2 tacking bolts. Do not remove the tacking bolts when attaching the working lines. If the counterbalance valve and motor are delivered separately, the counterbalance valve must first be fastened to the motor port plate using the tacking bolts provided. In both cases, the final fastening of the counterbalance valve to the motor is done using the threaded connection of the working lines, e.g. using SAE flanges. A total of 6 bolts with thread lengths B1+B2+B3 and 2 bolts with thread lengths B3+B4 will be required.

When tightening the bolts, it is vital that the sequence (1 to 8) as shown in the diagram is adhered to and carried out in two phases. In the first phase the bolts should be tightened to 50% of their tightening torque before being tightened to maximum tightening torque in a second phase (see table below).

Thread	Property class	Tightening torque
M10	10.9	55 lb-ft (75 Nm)
M12	10.9	95 lb-ft (130 Nm)
M14	10.9	150 lb-ft (205 Nm)

Speed Measurement (sizes 28 to 200)

The (A)A6VM...D and (A)A6VM...F ("prepared for speed measurement") versions have teeth on the drive shaft.

The rotating, toothed shaft generates a signal in proportion to the speed. The signal is picked up by a sensor and forwarded for evaluation.

The sensor is screwed into (inductive speed sensor ID) or flanged onto (Hall effect speed sensor HDD) the upper leakage-oil port T₁ (sizes 28 to 200). The spacer (sizes 28 to 107) or thread-reducing adapter (sizes 140 to 200) required for the inductive speed sensor is supplied with the sensor. For the sizes 55, 80, 107, 160 and 200 the port T is equipped with an adapter piece (M18x1.5) for the installation of the inductive speed sensor ID.

We recommend ordering the speed sensor and motor as a set.

Suitable sensors:

- Inductive speed sensor ID (see RE 95130) version "D"
- Hall-effect speed sensor HDD (see RE 95135) version "F"

On units employing speed measurement, port T₂ must be used to drain the leakage-oil (sizes 28 to 200).

Before finalising your design, please request a certified drawing. Dimensions in inches and (millimeters).

Swivel Angle Indicator (sizes 250 to 1000)

Before finalising your design, please request a certified drawing.
Dimensions in inches and (millimeters).

Optical swivel angle indicator (V)

The swivel position is indicated by a pin on the side of the port plate. The length of pin protruding out of the plate depends on the position of the control lens.

If it lies flush with the port plate, the motor is at start of control. At maximum swivel, the pin is 0.31 inches (8 mm) long (visible after removing the cap nut).

Sizes 250 to 1000

Example: Start of control at $V_{g \max}$

Electrical swivel angle indicator (E)

The position of the motor is signaled by an inductive position sensor. It converts the travel of the control device into an electrical signal.

The swivel position can be transmitted to an electrical control unit by means of this signal.

Inductive position sensor, model IW9-03-01

Degree of protection to DIN/EN 60529: IP65

The sealing ring in the cable gland (M16x1.5) is suitable for cables 0.18 in to 0.39 in (4.5 mm to 10 mm) in diameter.

The female connector is part of the scope of supply of the motor.

DEUTSCH DT04-2P-EP04, 2-pin

injection molded, without/with bidirectional quenching diode _ P, Q

DEUTSCH DT04-2P-EP04, 2-pin

with lead, without bidirectional quenching diode _____ **T**

1) Solenoid with DIA 1.77 (ø45) for following controls:
HA.U, HA.R (for elec. override), EZ3 and EZ4.
Degree of protection to DIN EN 60529: IP65

Hirschmann DIN EN 175 301-803-A/ISO 4400

without bidirectional quenching diode _____ **H**

2) Solenoid with DIA 1.77 (ø45) for following controls:
HA.U, HA.R (for elec. override), EZ3 and EZ4.
Not for new projects.

Installation and Startup Instructions

General

The motor case must be completely filled up with hydraulic fluid during startup and during operation (filling the case chamber). The motor must be started up at low speed and no load until the system has been bled completely.

If stopped for an extended period, fluid may drain out of the case through the working lines. When restarting, make sure that the case contains sufficient fluid.

The leakage fluid inside the case chamber must be drained off to the reservoir through the highest leakage-oil port.

The motor is designed to operate in any position.

Installation below the reservoir

Motor below minimum oil level in reservoir (standard)

- Fill axial piston motor before startup via the highest leakage-oil port
- Run the motor at low speed until the system is bled completely (bleed through service line port A, B if tubing is long)
- Minimum immersion depth of leakage line in reservoir:
7.87 in/200 mm (relative to the min. oil level in the reservoir)
- Additional measures required for installation position 2 (shaft facing up)

With installation position 2, make sure that the motor case is completely full before starting up. In this installation position the system must be bled via U. An air cushion in the vicinity of the bearing will damage the axial piston unit.

- Bleed the AA6VM variable displacement motor in a closed circuit:
 - via port G
 - no bleeding required if flushing valve fitted

Installation above the reservoir

Motor above minimum oil level in reservoir

- Proceed in same way as below the reservoir installation
- Additional measures for installation positions 1 and 2

If stopped for an extended period, fluid may drain out of the case chamber through the working lines (air enters through the shaft seal). The bearings will therefore not be properly lubricated when the motor is started up again. Fill the axial piston unit before restarting via the highest leakage-oil port. In installation position 2 the system must be bled via U.

- Additional measures required for installation position 2 (shaft facing up)

In this installation position the bearings will not be properly lubricated, even if there is still some fluid in the case chamber. Putting a check valve (opening pressure 7.25 psi/0.5 bar) in the leakage line can prevent the system emptying through the line.

Installation position 1

Safety Instructions

- The AA6VM motor is designed to be used in open and closed circuits.
- Project planning, assembly, and startup of the motor require the involvement of trained personnel.
- The working and functional ports are only designed to accommodate hydraulic piping.
- Tightening torques: The tightening torques mentioned in this data sheet are maximum values and must not be exceeded (max. values for thread).
Manufacturer's information concerning the maximum permitted tightening torques of the various fittings is to be observed!
For ISO 68 / DIN 13 mounting bolts, we recommend that tightening torques be checked on a case by case basis in accordance with VDI 2230, published 2003.
- There is a danger of burning while the motor is running and for a short time afterwards.
- The data and information contained herein must be adhered to.
